The wine industry faces the growing demand for sustainable and environmentally friendly production, through the use of hybrid varieties resistant to mold - based on crosses of Vitis vinifera with other Vitis spp with a high tolerance to attack by pathogens of the vine.

The analysis of the stable isotope ratio is the reference method to combat counterfeiting in the wine sector, also thanks to the establishment of official annual reference databases in which the intervals of isotopic variability are reported.

There is a varietal variation in the stable isotopic ratio of European Vitis vinifera to modern hybrid varieties?

MATERIALS

Wine samples produced with seven white varieties (Aromera, Bronner, Helios, Johanniter, Muscaris, Solaris, Souvignier Gris) and seven red varieties (Baron, Cabernet Cortis, Cabernet Cantor, Cabernet Carbon, Monarch, Prior, Regent) grown in two experimental plots sited in the north Italian region of Trentino were analysed for the stable isotopic ratio.

Results were compared to the ratio isotopic ratio of the wines obtained from Vitis vinifera varieties of the same production area.

STABLE ISOTOPE RATIO ANALYSIS (SIRs)

The analyses were carried out by isotopic ratio mass spectrometry (IRMS) and site-specific natural isotopic fractionation by nuclear magnetic resonance (SNIF-NMR), according to the official methods of the International Organisation of Vine and Wine (OIV).

RESULTS

Chardonnay (white wine) and Marzemino (red wine) constitute as the Vitis Vinifera reference varieties.

: Mean isotopic parameters determined in white wine in two vintages (2018-2019) and two plots (Navicello + Telve). Different letters in the same column indicate significant differences at ANOVA and Tukey test (95%)

White Wines	(D/H) _I	(D/H) _{II}	R	δ ¹³ C ‰ vs. V-PDB	δ18O ‰ vs. V-SMOW	
Chardonnay (n=2)	101,20 a	126.10 ab	2.5 a	-28.95 c	1.30 a	
Aromera (n=2)	102,00 a	129,00 a	2,55 a	-28,60 bc	2,35 a	
Bronner (n=4)	102,28 a	125,52 ab	2,45 a	-27,75 b	1,45 a	
Helios (n=3)	102,47 a	126,37 ab	2,46 a	-26,77 a	1,80 a	
Johanniter (n=3)	102,00 a	124,30 b	2,43 a	-28,50 bc	1,60 a	
Muscaris (n=4)	101,83 a	127,37 ab	2,50 a	-28,27 bc	0,90 a	
Solaris (n=4)	101,88 a	127,45 ab	2,50 a	-28,57 bc	2,87 a	
Souvignier Gris (n=4)	102,53 a	128,77 a	2,50 a	-28,22 bc	2,35 a	
Pr > F	0,892	0,016	0,48	<0,0001	0,526	
Significativity	No	Yes	No	Yes	No	

Hybrid show normally higher (D/H), and δ^{13} C of ethanol and δ^{18} O values than the reference variety grown on the same plot of land.

None of the wines, which compares the mean values of all varieties regardless their origin, differ significantly from each other.

Warning! In the evaluation it is necessary to keep the harvest years separate.

CONCLUSIONS

Some hybrid grape varieties have tendencies to deviate from the regional averages in their stable isotope ratios derived from conventional V. vinifera

red grape varieties such as Monarch, Cabernet Carbon and Cabernet Cantor and white grape varieties such as Solaris, Helios and Souvignier Gris.

Isotopic parameters determined in white and red wine in two vintages (2018-2019) and two plots (Navicello & Telve). The isotopic ratios are expressed in 8% relative to V-PDB for 813C of Ethanol, V-SMOW for 8100 of wine water. (*Reference Variety)

Navicello 2018		Deviations to the RV*: Chardonnay		/H) ₁	(D/H) _{II} 124,9		δ ¹³ C ‰ vs. V-PDB -29,3		δ ¹⁸ O ‰ vs. V-SMOW 1,4
