1st ISO-FOOD International Symposium on Isotopic and Other Techniques in Food Safety and Quality

Portorož, Slovenia
April 1-3, 2019

Organised by
ERA Chair ISO-FOOD in Isotope Techniques in Food Quality,
Safety and Traceability
Department of Environmental Sciences
Jožef Stefan Institute

Programme and Book of Abstracts
Programme and Book of Abstracts

Organised by:
ERA Chair ISO-FOOD in Isotope Techniques in Food Quality, Safety and Traceability
Department of Environmental Sciences
Jožef Stefan Institute

Edited by:
David Heath, Milena Horvat, and Nives Ogrinc
at IDPA-CNR Venice.
This multiparametric approach will allow us to define which parameters are more useful for trace back the geographic provenience of Cannabis sativa and its derived products.

PO-03
Application of chemometric tools for determination of authenticity of Serbian pear spirits
Biljana Marosanovic, Maja Lojovic, Aleksandra Bauer
SP Laboratorija, Serbia

In recent years, many food products have been losing their authenticity, uniqueness and characteristic of the area from which they originate. The authenticity of fruit spirits is one of the important issue regarding the consumer protection and it is based on the identification and elimination of fraud in the market. Pear spirit is a national, Serbian, alcoholic beverage with a great tradition and it becomes subject of falsification. Counterfeiting is related to ethanol content increasing, by adding sugar from sugar beet (C3 plant) or sugar cane and corn (C4 plant).

The determination of δ13C, δ2H and δ18O isotope ratios by Elemental Analyzer - Isotope Ratio Mass Spectrometry (EA-IRMS by Thermo) is a precise analytical method that can be used to check the authenticity, botanical and geographical origin of fruit spirits.

For detection of the adulteration, we have made laboratory control samples of spirits of pear, sugarcane and corn in SP Laboratorija. At the same time, we have prepared samples of pear spirits with different amount of added beet sugar (3%, 5%, 10%, 20% sugar was added on the weight of fruit during fermentation), from different geographical origin (South and North part of Serbia). Also, we collected pear spirits produced in Serbia in the period from 2005 until 2017. Combined results of δ2H and δ13C values gives an important information about botanical origin of ethanol and possibility of distinguishing between fruit spirits and spirits with non-fruit origin (made from beet sugar, maize, cane sugar).

In the aim of geographical classification for spirit samples, originating from different locations in Serbia, spirits has been determined by isotope ratio δ2H and δ18O.

Application of Chemometrics has established a linear correlation between the concentration of sugar values (derived from sugar beet) and δ2H values. Applying this equation, it is possible to calculate the amount of added sugar in the unknown sample.

The application of the formed database enabled the classification of commercial pear spirits on the basis of botanical and geographical origin.

The high cost of several species from the genus Tuber attracts more or less exquisite adulteration practices. The most known of the Tuber species in Europe are: Tuber magnatum Pico 1788 and Tuber melanosporum Vittadini 1831, followed by other commercially interesting species such as Tuber aestivum Chatin 1887, Tuber macrosporum Vittadini 1831, Tuber bromale Vittadini 1831, Tuber borchii Vittadini 1831, etc. Truffles are used in culinary as fresh fruiting bodies or as ingredients in the processed product. Since 2011 the truffle hunting is again legal in Slovenia and majority of Slovenian truffles comes from hunting wild truffles. While some of the species can be found in different parts of Slovenia, the two most appreciated T. magnatum and T. melanosporum are found only in Slovenian Istria.

In season 2017-2018, six truffle samples were collected in Slovenian Istria. Two samples of T. magnatum, one T. borchii, one T. melanosporum, and two T. aestivum were analyzed for elemental composition by X-ray fluorescence (XRF) and for stable isotope composition (H, O, C, N, and S) by isotope ratio mass spectrometry (IRMS). Stable isotope composition of carbon was also determined for the main volatile organic compounds by the use of headspace solid-phase microextraction (HS-SPME) coupled with IRMS.

There was high variability of δ2H, δ15N, and δ34S observed between different truffle species. The statistical evaluation of elemental and stable isotope compositions indicated that samples can be separated according to δ15N, Pb and P. δ13C values in VOC were also significantly different between different truffle species. It was also speculated that different VOC components can be produced not only by the truffle but also or exclusively by the microbes such as yeasts or bacteria.

These preliminary results of the ongoing study show that elemental composition and stable isotope composition could be used for determination of species variety and trophic status of truffles. It was also indicated that truffles offer a unique opportunity to better understand the ecological function of microbes associated with fungi and their involvement in aroma formation.

Acknowledgement: The research was performed within ARIMnet REALMed project with the aim of "Pursuing authenticity and valorization of Mediterranean traditional products".

PO-05
Establishing reproducibility in compound-specific stable isotope measurements for food authentication and adulteration
Chris Yarnes
University of California, Davis, Stable Isotope Facility, United States
